n8n — справочник по workflow JSON, нодам и AI Agent

Версия документа: 2025-12-20

Для разработчиков и ИИ агентов: как собирать и понимать workflow JSON, как устроены ноды и креденшелсы, и как работает AI Agent (Tools Agent).

Снимок каталога: n8n-nodes-base v1.113.2 (438 нод) и креденшелсы (385).

Примечание: список нод/креденшелсов можно автоматически обновлять (см. раздел 5).

Содержание

1. Базовые понятия n8n

n8n — платформа автоматизации (workflow automation), где вы соединяете ноды (nodes) в граф, запускаемый триггерами и/или вручную. Нода принимает items (массив объектов), делает обработку и отдаёт items дальше по веткам.

• Workflow — граф из нод и соединений.

• Node — операция/интеграция (HTTP запрос, чтение из Google Sheets, отправка сообщения в Telegram и т.д.).

• Credential — сохранённые секреты/ключи (API key, OAuth2 и т.д.), к которым привязываются ноды.

• Execution — конкретный запуск workflow (с логами и данными).

• Expressions — шаблоны в стиле {{ ... }}, чтобы подставлять данные из потока в параметры нод.

Важно: один и тот же workflow можно собирать визуально в UI и/или программно через JSON-описание, которое экспортируется/импортируется.

2. Workflow JSON: структура и правила

Экспорт workflow в n8n — это JSON с ключевыми секциями nodes и connections. Ниже — практическая «спецификация» того, что ИИ агенту чаще всего нужно знать для генерации корректного workflow JSON.

2.1. Минимальный пример workflow JSON

```
{
  "name": "Demo: HTTP → Set",
  "nodes": [
    {
      "id": "1",
      "name": "HTTP Request",
      "type": "n8n-nodes-base.httpRequest",
      "typeVersion": 4,
      "position": [420, 300],
      "parameters": {
        "url": "https://example.com/api",
        "method": "GET",
        "responseFormat": "json"
      }
    },
    {
      "id": "2",
      "name": "Set",
      "type": "n8n-nodes-base.set",
      "typeVersion": 3,
      "position": [700, 300],
      "parameters": {
        "keepOnlySet": true,
        "values": {
          "string": [
            { "name": "source", "value": "={{ $node['HTTP Request'].json.url || 'example' }}" }
          ]
        }
      }
    }
  ],
  "connections": {
```

```
        "HTTP Request": {
          "main": [
            [
              { "node": "Set", "type": "main", "index": 0 }
            ]
          ]
        }
      },
      "active": false,
      "settings": {}
    }
```

Критично: объект connections ссылается на name нод (не на id). Поэтому имена должны быть уникальными внутри workflow.

2.2. Поля объекта node

• id: строка-идентификатор (часто UUID, но при импорте может быть и простое значение).

• name: отображаемое имя ноды. Используется в connections.

• type: тип ноды, например n8n-nodes-base.httpRequest.

• typeVersion: версия описания ноды (важно для совместимости).

• position: [x, y] координаты на канвасе.

• parameters: параметры ноды (то, что вы заполняете в UI).

• credentials (опц.): какие креды использует нода, например { "telegramApi": { "id": "...", "name": "..." } }.

• disabled, continueOnFail, alwaysOutputData и др. (опц.): поведение выполнения.

2.3. Поля connections: как описываются связи

Связи описываются от выходов одной ноды к входам другой. В большинстве нод основной выход называется main и имеет массив выходных «портов».

```
"connections": {
  "If": {
    "main": [
      [ { "node": "Send True", "type": "main", "index": 0 } ],
      [ { "node": "Send False", "type": "main", "index": 0 } ]
    ]
  }
}
```

Пример выше: у ноды If два выхода (ветки True/False). Каждый выход — список подключений.

2.4. Expressions и доступ к данным

Expressions в n8n пишутся внутри ={{ ... }} и позволяют обращаться к данным текущего item и к результатам других нод.

```
={{ $json.email }}
={{ $node["HTTP Request"].json.data.id }}
={{ $items("Some Node")[0].json }}
```

Для генерации workflow JSON ИИ агенту важно: выражения — это строки, а не отдельный тип. Они живут внутри параметров нод.

3. Типы нод и типовые строки type

В workflow JSON поле type задаёт реализацию ноды. Для базовых нод (пакет n8n-nodes-base) типы выглядят как `n8n-nodes-base.<node_key>`.

Список node_key и соответствующие файлы реализации можно получить из `dist/known/nodes.json` пакета n8n-nodes-base (см. приложение).

4. AI Agent (Tools Agent) в n8n

AI Agent — root-нода из AI/LLM «кластерных» нод. Она связывается с Chat Model, Memory и инструментами (Tools), чтобы агент мог вызывать действия.

4.1. Что изменилось в новых версиях

В документации n8n отмечено, что до версии 1.82.0 в AI Agent можно было выбирать разные типы агента, но это убрали: теперь все AI Agent ноды работают как Tools Agent (рекомендованный и самый используемый режим).

Также указано, что к AI Agent нужно подключить как минимум один tool (sub-node).

```
Ключевая мысль:
- современный AI Agent = Tools Agent
- без tool-подключений агент работать не будет (нужно минимум 1 tool)
```

4.2. Как собрать AI Agent workflow по «каноническому» паттерну

• Chat Model: отдельная sub-нода (например OpenAI Chat Model / Anthropic Chat Model / Ollama Chat Model).

• Memory: Simple Memory / Redis Chat Memory / Postgres Chat Memory и т.п. (опционально, но почти всегда нужно).

• Tools: один или несколько инструментов (например: Calculator, Custom Code Tool, Call n8n Workflow Tool, HTTP Request Tool и др.).

• Root: AI Agent нода, к которой сходятся Chat Model + Tools (+ Memory).

Рекомендация для JSON-генерации: сначала сгенерируйте skeleton (root + sub-nodes + connections), затем заполняйте параметры моделей/инструментов.

5. Как автоматически получить «все данные по нодам» (схемы параметров)

Полный список нод — это только первый шаг. Чтобы ИИ агент «понимал, как строить ноды», ему нужна схема параметров (NodeDescription) каждой ноды. Это реально получить автоматически из npm-пакетов n8n.

5.1. Два уровня данных

• Каталог типов: имя ноды (node_key), строка type, путь к файлу реализации. Это лежит в `dist/known/nodes.json`.

• Схема параметров: содержимое `node.description` (properties, inputs/outputs, defaults, etc.). Это находится внутри JS-класса ноды.

5.2. Пример извлечения схемы ноды через Node.js

```
// 1) Установите пакет с нодами
//    npm i n8n-nodes-base

// 2) Импортируйте класс ноды и выведите её описание (schema)
const { HttpRequest } = require('n8n-nodes-base/dist/nodes/HttpRequest/HttpRequest.node');

const node = new HttpRequest();
console.log(node.description); // <-- здесь вся схема параметров (NodeDescription)
```

5.3. Массовая выгрузка схем всех нод

```
/**
 * Идея:
 * 1) прочитать dist/known/nodes.json
 * 2) для каждого node_key взять sourcePath
 * 3) require() по sourcePath, создать экземпляр, взять .description
 * 4) сохранить в единый JSON (node_key -> description)
 */
const fs = require('fs');

const known = JSON.parse(fs.readFileSync('node_modules/n8n-nodes-base/dist/known/nodes.json', 'ut

const out = {};
for (const [nodeKey, meta] of Object.entries(known)) {
  const mod = require('n8n-nodes-base/' + meta.sourcePath);
  const Cls = mod[meta.className];
  const inst = new Cls();
  out[nodeKey] = inst.description;
}

fs.writeFileSync('ALL_NODE_DESCRIPTIONS.json', JSON.stringify(out, null, 2));
```
Результат ALL_NODE_DESCRIPTIONS.json — это практически «полная база знаний по нодам», которую удобно «скормить» вашему ИИ агенту.

6. Источники и как обновлять снимок

Этот документ собран на основе официальной документации n8n и содержимого опубликованных npm-пакетов (UNPKG). Чтобы обновить снимок:

• Откройте в UNPKG нужную версию n8n-nodes-base и скачайте dist/known/nodes.json и dist/known/credentials.json.

• Пересоберите таблицы (каталог нод/кредов) и при необходимости выгрузите .description всех нод по скрипту выше.

• Для AI/LLM нод используйте пакет @n8n/n8n-nodes-langchain (аналогичный подход).

В конце документа — приложения с полными таблицами нод и креденшелсов для n8n-nodes-base v1.113.2.

Приложение A. Каталог нод (n8n-nodes-base v1.113.2)

Колонки: node_key, type, credentials (keys), sourcePath.

node_key	type	credentials	sourcePath
Brandfetch	n8n-nodes-base.Brandfetch	brandfetchApi	dist/nodes/Brandfetch/Brandfetch.node.js
actionNetwork	n8n-nodes-base.actionNetwork	actionNetworkApi	dist/nodes/ActionNetwork/ActionNetwork.node.js
activeCampaign	n8n-nodes-base.activeCampaign	activeCampaignApi	dist/nodes/ActiveCampaign/ActiveCampaign.node.js
